

**Amendments to the Specification:**

Please replace the paragraph beginning on page 3, line 12, with the following paragraph:

In order to provide good elasticity and a relatively high coefficient of friction, the drag element preferably is made of a rubber-like material; however, in order to still provide a precise alignment, as well as stability, this drag element may be reinforced with metal.

Rubber-like is defined as having an elastic texture resembling rubber in coefficient of friction, flexibility, and toughness.
